CS 7641 Machine Learning

# CS 7641 Machine Learning Fall 2014

#### Instructor of Record:

Charles Isbell, <u>isbell@cc.gatech.edu</u> 259, College of Computing Building

#### Creators of Online Material:

Prof. Charles Isbell, <u>isbell@cc.gatech.edu</u> Prof. Michael Littman, <u>littman@cs.brown.edu</u>

#### TAs:

Pushkar Kolhe, <u>pushkar@cc.gatech.edu</u> (also original Course Developer)

#### Required Text:

## Machine Learning

by Tom Mitchell, McGraw Hill, 1997

#### General Information

Machine Learning is a three-credit course on, well, Machine Learning. Machine Learning is that area of Artificial Intelligence that is concerned with computational artifacts that modify and improve their performance through experience. The area is concerned with issues both theoretical and practical. This particular class is a part of a series of classes in Machine Learning, and takes care to present algorithms and approaches in such a way that grounds them in larger systems. We will cover a variety of topics, including: statistical supervised and unsupervised learning methods, randomized search algorithms, Bayesian learning methods, and reinforcement learning. The course also covers theoretical concepts such as inductive bias, the PAC and Mistake-bound learning frameworks, minimum description length principle, and Ockham's Razor. In order to ground these methods the course includes some programming and involvement in a number of projects.

# **Objectives**

There are four primary objectives for the course:

- To provide a broad survey of approaches and techniques in ML
- To develop a deeper understanding of several major topics in ML
- To develop the design and programming skills that will help you to build intelligent, adaptive artifacts
- To develop the basic skills necessary to pursue research in ML

The last objective is the core one: you should develop enough background that you can

T-Square: CS-7641-O01: Syllabus 8/20/14, 8:38 PM

ML as a research career, or to apply ML techniques in other research areas in interesting (as opposed to uninteresting) ways.

## **Prerequisites**

The official prerequisite for this course is an introductory course in artificial intelligence. In particular, those of you with experience in a general representational issues in AI, some AI programming, and at least some background (or barring that, willingness to pick up some background) in statistics and information theory should be fine. Any student who did well in an AI course <u>like this one</u> should be fine. You will note that the syllabus for that particular course suggests at least some tentative background in some machine learning techniques as well. Having said all that, the most important prerequisite for enjoying and doing well in this class is your interest in the material. I say that every semester and I know it sounds trite, but it's true. In the end it will be your own motivation to understand the material that gets you through it more than anything else. If you are not sure whether this class is for you, please talk to me.

#### Resources

- **Readings.** The textbook for the course is *Machine Learning* by Tom Mitchell. We will follow the textbook quite closely for most of the semester, so it is imperative that you have a copy of the book. We will also use supplemental readings as well, but those will be provided for you.
- Computing. You will have access to CoC clusters for your programming assignments. You are free to use whatever machines you want to do your work; however, the final result will have to run on the standard CoC boxes. Exactly what this means will be spelled out. This shouldn't be much of a restriction for you.
- **Web.** We will use the class web page to post last minute announcements, so check it early and often.

## Statement of Academic honesty

At this point in your academic careers, I feel that it would be impolite to harp on cheating, so I won't. You are all adults, more or less, and are expected to follow the university's code of academic conduct (you know, the honor code). Furthermore, at least some of you are researchers-in-training, and I expect that you understand proper attribution and the importance of intellectual honesty.

Please note that unauthorized use of any previous semester course materials, such as tests, quizzes, homework, projects, videos, and any other coursework, is prohibited in this course. In particular, you are not allowed to use old exams. Using these materials will be considered a direct violation of academic policy and will be dealt with according to the GT Academic Honor Code. Furthermore, I do not allow copies of my exams out in the ether (so there should not be any out there for you to use anyway). Just as you are not to use previous material you are not to share current material—including lecture material—with others either now or in the future. My policy on that is strict. If you violate the policy in any shape, form or fashion you will be dealt with according to the GT Academic Honor Code. I also have several... friends... from Texas who will help me personally deal with you.

# Readings and Lectures

My research area is machine learning, and I'm deeply into the area. Given that and my enormous lung capacity, and my tendency to get distracted, it turns out that I can ramble on about the material for days on end, even with an editor to try to make me concise; however, that rather misses the point.

The online lectures are meant to summarize the readings and stress the important points. You are expected to critically read any assigned material. Your active participation in the material, the lectures, and various forums are crucial in making the course successful. This is less about my teaching than about your learning. My role is merely to assist you in the

T-Square: CS-7641-001: Syllabus 8/20/14, 8:38 PM

process of learning more about the area.

Here are the topics we expect to cover this term along with the corresponding readings:

Introduction and Overview	Chapter 1
Supervised Learning Review: Neural Networks & Decision Trees	Chapters 3 & 4
Instance Based Learning	Chapter 8
Boosting & Support Vector Machines	see resources link for handouts
Support Vector Machines & Boosting	see resources link for handouts
Bayesian Learning	Chapter 6
Computational Learning Theory	Chapter 7
Addressing Overfitting & Information Theory	Chapter 5 & see resources link for handouts
Randomized Optimization	Chapter 9 & see resources link for handouts
Clustering	see resources link for handouts
Expectation Maximization & Impossibility results (clustering and NFL)	Chapter 6 (again) & see resources link for handouts
Feature Selection	see resources link for handouts
Feature Transformation	see resources link for handouts
MDPs and Reinforcement Learning	Chapter 13
Game Theory and Multi-Agent Reinforcement Learning	see resources link for handouts

# Grading

Your final grade is divided into three components: assignments, a midterm and a final exam.

- Assignments. There will be four graded assignments, one for the first section, two for the second, and one for the third. They will be about programming and analysis. Generally, they are designed to give you deeper insight into the material and to prepare you for the exams. The programming will be in service of allowing you to run and discuss experiments, do analysis, and so on. In fact, the programming is incidental, as you shall see.
- Midterm. There will be a written, closed-book midterm roughly halfway through the term.
